

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1. (currently amended) An image analysing focusing device for an infrared optical apparatus (10) comprising:

a controllable optical convergence element means (20);[[,]]
an image detector detection means (30) arranged so as to receive an image of an object projected by onto which the optical convergence element; means (20) is projecting an image of an object, and

a processor arranged so as to receive processing means (40) for processing signals from the image detector and to generate detection means (30) to provide control signals to control the optical convergence element means (20) to focus the image of the object onto the image detector detection means (30), characterised by;

wherein the processor comprises a search element constructed and arranged so as to analyze operation means (140) in the processing means (40) analysing the image on the image detector detection means (30) to find select at least one image window in the image in connection with for which a focusing operation is to be done performed in accordance with predetermined conditions; and

wherein the processor further comprises a focusing function
~~means element~~ (150) in the processing means (40) constructed and
arranged so as to control the optical convergence element so as
to focus a portion of the image within ~~providing a focusing on~~
the at least one image window ~~based on providing as distinct~~
~~differences between individual detecting positions (pixels)~~
~~within the image window as possible~~ using an iterative process;

wherein the iterative process comprises the steps of:
~~image analyzing focusing device is constructed and arranged to~~
~~operate in the infrared range~~

performing a coarse focusing using only a first range
of spatial frequency components of the image; and

after the coarse focusing step, performing a fine
focusing using only a second range of spatial frequency
components of the image, the second range being higher than the
first range.

2. (canceled)

3. (currently amended) Device as claimed in claim [[2]]
1, ~~characterised in that~~ wherein the coarse focusing is ~~done by~~
~~analysing the FMF with~~ step comprises a "hill-climbing" technique
and the fine focusing step comprises ~~is done by analysing the FMF~~
~~with~~ a "curve-fitting" technique.

4. (previously presented) Device as claimed in claim 1,
characterised in that the predetermined conditions provide
options:

to choose a focus window area of the image detection means (30), other than the most centrally situated area;

to store acquired focus images digitally in a memory location (160) of the processing means (40); and

to combine the device with various kinds of supporting semi-automatic or fully automatic decision-making systems.

5. (currently amended) ~~Device as claimed in claim 1, characterised in that~~ An image analysing focusing device for an infrared optical apparatus (10) comprising:

a controllable optical convergence element (20);

an image detector (30) arranged so as to receive an image of an object projected by the optical convergence element; and

a processor arranged so as to receive signals from the image detector and to generate control signals to control the optical convergence element (20) to focus the image of the object onto the image detector (30);

wherein the processor comprises a search element constructed and arranged so as to analyze the image on the image detector (30) to select at least one image window in the image in connection with which a focusing operation is to be performed in accordance with predetermined conditions; and

wherein the processor further comprises a focusing element (150) in the processing means (40) constructed and arranged so as to control the optical convergence element so as to focus the

image on the at least one image window using an iterative process;

wherein the predetermined conditions for ~~finding~~ selecting
the image window ~~comprise a coupling of the device to a sensor~~
~~instrumentation (100) enabling focusing on objects within the~~
~~imaged view area depending on their thermal properties of objects~~
represented within the image.

6. (currently amended) Device as claimed in claim 5,
~~characterised in that the~~ further comprising sensor
instrumentation (100) ~~is used while monitoring~~ constructed and
arranged so as to be able to monitor predetermined temperature
differences or changes within the image window.

7. (currently amended) Device as claimed in claim 5,
~~characterised in that the predetermined conditions comprise~~
~~providing the~~ further comprising sensor instrumentation (100)
with a radiometric calibration device (110).

8. (original) Device as claimed in claim 7,
characterised in that the sensor instrumentation (100) and the
radiometric calibration device (110) are used while monitoring
predetermined temperatures or temperature intervals within the
image window.

9. (previously presented) Device as claimed in claim 1,
characterised in that the predetermined conditions comprise semi-
automatic or fully automatic calibration of the relation between
of at least two of the following parameters:

distance from the apparatus (10) to a viewed object;
temperature of the optical convergence means (20); and
focus position of the optical convergence means (20),
which calibration is supported by the automatic focusing.

10. (previously presented) Device as claimed in claim 1, characterised in that the predetermined conditions comprise estimation of a distance from the apparatus (10) to a viewed object based on information on temperature and/or position of the optical convergence means (20).

11. (original) Device as claimed in claim 10, characterised in that the predetermined conditions comprise estimation of a distance from the apparatus (10) to a viewed object based on information on temperature and/or position of the optical convergence means (20) comprising at least one of the options:

- presenting estimated distance to the viewed object;
- presenting inaccuracy of the estimation;
- presenting a combination of the above estimated distance and inaccuracy;

- presenting data only when the search operation means (140) has obtained an acceptable focus position.

12. (original) Device as claimed in claim 10, characterised in that an estimation of the temperature of a viewed object is done based on information on an estimation of distance from the apparatus (10) to a viewed object provided by

the calibration device (110), optics temperature and/or position of the optical convergence means (20).

13. (original) Device as claimed in claim 12, characterised in that an estimation of the temperature of a viewed object is done based on information on a distance from the apparatus (10) to a viewed object, optics temperature focus position of the optical convergence means (20) comprising at least one of the options:

presenting estimated temperature of the viewed object;

presenting inaccuracy of the estimation;

presenting a combination of the above estimated temperature and inaccuracy;

presenting data only when the search operation means (140) has obtained an acceptable focus position.

14. (previously presented) Device as claimed in claim 1, characterised in that the predetermined conditions for finding the image window comprise coupling to a movement detection device (130) which coupling enables focusing on moving objects, by means of the focusing function means (150), whereby the focus window is movable across the image and follows the moving object in the window during the focusing.

15. (previously presented) Device as claimed in claim 1, characterised in that the predetermined conditions for finding the image window comprise correlation of a geometrical object in the image with a pre-defined geometrical object in the focusing

function means (150) prior to focusing on the particular geometrical object of the viewed image.

16. (previously presented) Device as claimed in claim 15, characterised in that the focusing function means (150) for correlation comprises the geometrical objects as 2-dimensional electronic images supplied via an information transmitting means.

17. (previously presented) Device as claimed in claim 1, characterised in that the predetermined conditions comprise a calculation by the focusing function means (150) of possible ranges for the focus position at a certain temperature, whereby image analysis in impossible intervals can be omitted and processing capacity reduced.

18. (previously presented) Device as claimed in claim 1, characterised in that the predetermined conditions comprise control by the focusing function means (150) to adjust the focus position to infinity when no object to focus on can be found within the viewed image.

19. (previously presented) Device as claimed in claim 1, characterised in that the device is used in a pan-tilt type of equipment where the processing unit (40) controls a repeated sequence of movements between pre-defined objects or focus windows within the viewed image and may send notification messages in response to predetermined trigger conditions.

20. (original) Device as claimed in claim 19, characterised in that the pan-tilt equipment in the processing

unit (40) includes a register (160) of preceding focus data used for adjusting the focus position or a nearby focus position already during the moving from one viewed area to the next area to be viewed, whereby the focusing is obtained faster leading to more efficient operation.

21. (original) Device as claimed in claim 19, characterised in that the predetermined trigger conditions comprise for instance thermal conditions and/or object movements within a pre-defined area.

22. (previously presented) Device as claimed in claim 1, characterised in that it may be used in combination with or be equipped with an integrated semi-automatic or fully automatic zooming device.

23. (previously presented) Device as claimed in claim 1, characterised in that it may be used in combination with or may be equipped with an integrated position determining device, such as a global positional system, GPS, whereby the processing means (40) may calculate and present positions of viewed objects relative to positional data from the GPS.

24. (currently amended) An image analysing focusing method for an infrared optical apparatus (10) comprising controllable optical convergence ~~means~~ element (20), an image detector detecting means (30) arranged so as to receive an image of an object projected by onto which the optical convergence means element (20), a processor arranged so as to receive is

~~projecting an image of an object, processing means (40) for~~
~~processing signals from the image~~ detector and to generate
~~detecting means (30) to provide~~ control signals to control the
optical convergence ~~means~~ element (20) to focus the image of the
object onto the image ~~detecting means~~ detector (30),
~~characterised by the focusing method comprising the steps of:~~

analysing the image on the image ~~detecting means~~
detector (30) to find at least one image window in the image for
which a focusing is to be done in accordance with predetermined
conditions; and

providing a focusing on the at least one image window
based on providing as distinct differences between individual
detecting positions (pixels) within the image window as possible
using an iterative process comprising the steps of:

~~wherein the focusing is performed using light in the~~
~~infrared range~~

performing a coarse focusing using only a first range
of spatial frequency components of the image; and

after the coarse focusing step, performing a fine
focusing using only a second range of spatial frequency
components of the image, the second range being higher than the
first range.

25. (currently amended) Method as claimed in claim 24,
~~characterised in that the focusing is divided into a coarse~~
~~focusing step using FMF based on low spatial frequencies in the~~

~~image and a fine focusing step using FMF based on high spatial frequencies in the image, whereby wherein the two coarse and fine focusing steps may be are combined for an optimum result.~~

26. (original) Method as claimed in claim 24, characterised in that the coarse focusing is done by analysing the FMF with a "hill-climbing" technique and the fine focusing is done by analysing the FMF with a "curve-fitting" technique.

27. (previously presented) Method as claimed claim 24, characterised in that the predetermined conditions of the focusing comprise use of a focus function of the form $FMF(z) = \frac{1}{N} \sum (K \otimes I_z - m)^2$, where K is an operator, N a factor of normalisation and m is a variable.

28. (original) Method as claimed in claim 27, characterised in that the operator values of the focus function comprise: $K = \begin{bmatrix} 1 & 1 & 1 \end{bmatrix}$, $K = \begin{bmatrix} 1 & -1 \end{bmatrix}$, $K = \begin{bmatrix} 10 & -1 \end{bmatrix}$ and $K = \begin{bmatrix} 1 \end{bmatrix}$.

29. (currently amended) Method as claimed in claim 28, characterised in that use of the operator values of the focus function is made with a variation depending on individual requirements of each system, ~~for instance~~ by applying the operator functions in more than one direction in the image.

30. (previously presented) Method as claimed in claim 24, wherein the method is applied to perform at least one of the following functions:

inspection of electrically operating devices;

temperature related process inspection, monitoring and
surveillance;

medical, chemical, petrochemical and furnace
inspection,;

research and development;

human, civilian and military surveillance.

31. (previously presented) The image analyzing focusing
device of claim 1, wherein the iterative process is a variable
iterative process that operates so as to maximize contrast.

32. (previously presented) The image analyzing focusing
device of claim 31, wherein the variable iterative process is
selected based on spatial frequencies of the image.

33. (previously presented) The image analyzing focusing
method of claim 24, wherein the iterative process is a variable
iterative process that operates so as to maximize contrast.

34. (previously presented) The image analyzing focusing
method of claim 33, wherein the variable iterative process is
selected based on spatial frequencies of the image.

35. (new) The device of claim 5, wherein the
predetermined condition underlying the selection of the at least
one image window is based on identification of a portion of the
image representing a highest temperature.

36. (new) The device of claim 5, wherein the
predetermined condition underlying the selection of the at least

one image window is based on identification of a portion of the image representing a lowest temperature.
